# OLSENBEAL – EXPERIENCE THAT COUNTS

Since our beginnings in 1987, OLSENBEAL has specialized in heavy industrial construction. We have worked extensively in a variety of locations throughout the West, including companies such as Geneva Steel, Continental Lime, Holnam Cement Plant, and Ashgrove Cement Plant.

In 1991 we participated in the modernization of the Geneva Steel Mill located in Vineyard, Utah. We performed the steel erection and mechanical installation for the \$100 million continuous caster project. Concurrent with that project we removed and reinstalled a widened roll-line from 6' to 10' in width. Our peak employment was up to 175 ironworkers and millwrights. During that period in time, we removed over 100 carloads of roll-line related equipment from a steel mill in Pennsylvania. We completed many other projects for Geneva Steel up through 1998 that involved extensive heavy rigging and millwright work.

Over the years we performed many kinds of industrial work including: kiln installations, bull gear installations, various kiln section replacements, U-tube upgrades and replacements, clinker silo and loading dock installation, crusher repairs and modification, and heavy equipment installations for expansion projects. We also have performed plan general maintenance and specialized maintenance on plant shut downs.

In recent years we have rigged and erected several heavy reactor units and many other processing units with weights reaching up to 350-tons. We have erected steel pipe supports, structural steel framing, and other misc steel required to expand the refinery and other plant capacities. We recently purchased a Kobelco SL6000 crawler crane which has a lifting capacity of up to 600-tons.

We carry the AISC Advanced Certified Steel Erector classification. If you need your project completed safe and efficient – give OlsenBeal a call TODAY.
